

Business Continuity & Disaster Recovery Plan

Organization: Rough Cut Manufacturing — operator of WorkTrackPro

Plan Owner: Jacob Rough, Chief Executive Officer — jacobrrough@gmail.com

Version: 1.0 **Effective Date:** June 17, 2026 **Next Review:** June 17, 2027

1. Purpose

This plan describes how Rough Cut Manufacturing maintains and restores the availability of the WorkTrackPro application and its data during and after a disruption (e.g., data loss, provider outage, or corruption).

2. Critical systems & dependencies

- **Supabase** — production database, authentication, and file storage (system of record).
- **Netlify** — application hosting and serverless/integration functions.
- **GitHub** — source-code repository and deployment source.
- **Integrations** — Plaid and QuickBooks Online (non-critical to core operation; degrade gracefully if unavailable).

3. Recovery objectives

- **Recovery Point Objective (RPO):** ~~"d 24 hours"~~ supported by Supabase automated backups and point-in-time recovery (data loss is bounded to the most recent recoverable point).
- **Recovery Time Objective (RTO):** ~~"d 1 business day"~~ for core application availability.

4. Backup strategy

- Production data is backed up automatically by Supabase, with point-in-time recovery available.
- Application code is version-controlled in GitHub; the production build can be redeployed to Netlify from source at any time.
- Configuration and secrets are stored in the Netlify environment and are re-creatable by the Plan Owner.

5. Recovery procedures

- **Data loss/corruption:** restore the Supabase database to a healthy point using point-in-time recovery; verify data integrity before resuming normal use.
- **Hosting/app failure:** redeploy the application from GitHub to Netlify; if Netlify is unavailable, redeploy to an alternative static/functions host using the same build.
- **Provider outage (Plaid/QuickBooks):** core job and accounting features continue; bank-feed and accounting sync resume automatically when the provider recovers (cursor-based sync resumes where it left off).
- **Credential compromise:** rotate keys and provider tokens (see the Incident Response Plan).

6. Communication

During a significant disruption, the Plan Owner communicates status and expected restoration to affected users and, where relevant, customers and providers.

7. Review & testing

This plan is reviewed at least annually and after any material change. The Plan Owner periodically verifies that backups are present and that the redeploy-from-source path is functional.
